# Registration

Users using mobile numbers which have never been registered before will receive an authentication code by SMS. Users should enter the code into the app to complete verification. The app will automatically generate random encryption keys (current encryption keys are "RSA2048") in the device and upload a public key and customized username to complete registration

Users using mobile numbers which have been registered before will receive an authentication code by SMS. Users should enter the code into the app to complete verification and server-side checks for backup encryption keys will occur.

If there are backup encryption keys, the app will verify the codes. After verification, the device will restore all backed up app data including encryption keys, messages, and address books. This username to allows users to install the app with the option to restore previously backed up account information before installation.

If there are no backup encryption keys, the app will automatically produce random encryption keys on the device and upload a public key and customized complete registration. Users can register a brand new account without restoring previously backed-up app data.

# Message interface

### New messages

When the user receives a new encrypted message, displayed in red the latest message will appear at the top of the chats number of unread messages.

The number of new messages will be bubbles on the top right corner of each chat as well as page along with the on the app icon on the home screen.

### Message

In the message input box below, the plaintext will be encrypted and sent to the oneto-one or group chat room after entering the message content.

If delivering a text is successful, the new message below the chat room will show a new cipher text which will be automatically flipped into plaintext.

You can leave and delete the group by pressing the action icon in the top right corner.

If delivery of a message fails, the new message below the chat room will be transcribed into plain text with a red label uploaded by the cloud indicates that the message has not been completed, and you can press again to resend the message.

If a new message is received, it will been displayed on the left in chronological order. The most recent encrypted message will be diplayed from below. When the user checks the encrypted text, the decrypted plaintext will decode after the flip. Meanwhile, the read notification will be sent back. Later, the user who sends the message will receive the read time label below the original message, indicating that the recipient has decrypted and seen the plaintext.

▲ 我人下午外出了,您可 能需要明天經過時順何 複 2 納 轉 發 副 副 除 3 移除明文 The record of the

chat room can be long-pressed and the floating list can be displayed. You can copy, delete, or forward text.
